Best Practices Using Enterprise Server on AWS ........................................................................38
This Quick Start was created by Micro Focus, Inc. in collaboration with Amazon Web Services (AWS).

Quick Starts are automated reference deployments that use AWS CloudFormation templates to deploy key technologies on AWS, following AWS best practices.

Quick Links

The links in this section are for your convenience. Before you launch the Quick Start, please review the architecture, security, and other considerations discussed in this guide.

- If you have an AWS account, and you’re already familiar with AWS services and Micro Focus Enterprise Server, you can launch the Quick Start to build the architecture shown in Figure 1 in a new or existing virtual private cloud (VPC). The deployment takes approximately 1 hour and 15 minutes. If you’re new to AWS or to Micro Focus Enterprise Server, please review the implementation details and follow the step-by-step instructions provided later in this guide.

- If you want to take a look under the covers, you can view the AWS CloudFormation templates that automate the deployment.
Overview

This Quick Start reference deployment guide provides step-by-step instructions for deploying Micro Focus Enterprise Server 4.0 for Windows on the AWS Cloud.

This Quick Start is for you if you are:

- An existing Micro Focus customer who has already deployed an IBM mainframe workload to Enterprise Server on premises and want to see how easy it is to migrate these rehosted applications to the AWS Cloud.
- Interested in exploring the feasibility of moving an IBM mainframe workload to the AWS Cloud and want to experience a fully functioning production server for running mainframe applications that can be deployed with a single click.
- A system integrator (SI) who is used to installing and configuring Enterprise Server deployments on premises, and wants a template to use as a starting point for installing and configuring Enterprise Server deployments on AWS.

The Quick Start creates the required infrastructure for both AWS Cloud and Enterprise Server. This makes it easy for you to see a fully-functioning demonstration application called BankDemo—using COBOL, CICS, Job Control Language (JCL), and Virtual Storage Access Method (VSAM) files—running under Enterprise Server on AWS.

Micro Focus Enterprise Server on AWS

Micro Focus Enterprise Server is an application deployment environment for IBM mainframe applications that have been running on the IBM z/OS operating system. Enterprise Server enables you to modernize and integrate mainframe applications with technologies such as .NET and Java. It also gives you application flexibility across Linux and Microsoft Windows, containerized or virtual, on AWS.

Using Enterprise Server, your organization can:

- Support mainframe application deployment to Linux or Windows on AWS.
- Rapidly replicate business-critical functionality to new platforms to support geographic, regulatory, line-of-business, or other key requirements.
- Reduce your ongoing IT application costs by as much as 90 percent.
- Meet and exceed your application reliability, availability, and serviceability requirements.
• Integrate with your security infrastructure, for appropriate application and system security.

For more information on the architecture employed by Enterprise Server, see Enterprise Server Architecture Overview.

In addition, by using Enterprise Server on AWS, you can harness the following benefits of moving any application to the AWS Cloud:

• A high-availability deployment environment that scales as your applications need it to and only charges you for the resources that you use.

• The ability to quickly build new services targeting new channels, such as mobile or voice-based applications.

• Big data services that provide analytics capabilities enabling you to create a data lake that offers a comprehensive view of your mainframe data assets.

• Amazon Machine Learning (Amazon ML) to help you use your historical data to make even better business decisions. Amazon ML can find patterns in your data and then use the patterns to build models to make predictions on future data.

Costs and Licenses

You are responsible for the cost of the AWS services used while running this Quick Start reference deployment. There is no additional cost for using the Quick Start.

The AWS CloudFormation template for this Quick Start includes configuration parameters that you can customize. Some of these parameters, such as instance type, will affect the cost of deployment. For cost estimates, see the pricing pages for each AWS service you will be using. Prices are subject to change.

Tip  After you deploy the Quick Start, we recommend that you enable the AWS Cost and Usage Report to track costs associated with the Quick Start. This report delivers billing metrics to an S3 bucket in your account. It provides cost estimates based on usage throughout each month, and finalizes the data at the end of the month. For more information about the report, see the AWS documentation.

This Quick Start uses a Bring Your Own License (BYOL) model for Enterprise Server. How you license Enterprise Server for use with this Quick Start depends on what sort of license you have:

• If you are an existing user of Enterprise Server you can use one of your existing licenses.
If you are not an existing user of Enterprise Server, you can request a trial license from Micro Focus.

This trial license for Enterprise Server on AWS is only intended to be used for a maximum of 90 days, and is not intended for production use. After the trial period, you are responsible for acquiring the necessary licenses directly from Micro Focus to continue using Enterprise Server on AWS.

Architecture

Architecture of Enterprise Server on AWS

Deploying this Quick Start for a new virtual private cloud (VPC)—specifying the inclusion of the BankDemo demonstration application, but otherwise using default parameters—builds the following Enterprise Server environment in the AWS Cloud.
Figure 1: Quick Start architecture for Enterprise Server on AWS

Note If you need to customize the supplied AWS CloudFormation template to deploy your own Enterprise Server applications to the AWS Cloud, the resulting AWS architecture could be very different to the one described in this section.
The Quick Start sets up the following:

- A highly available architecture that spans two Availability Zones.*
- A VPC configured with public and private subnets according to AWS best practices, to provide you with your own virtual network on AWS.*
- An internet gateway to allow access to the internet. *

When deploying the optional BankDemo demonstration applications, TN3270 communications from the internet will also flow through the internet gateway.

- In the public subnets, managed NAT gateways to allow outbound internet access for resources in the private subnets.*
- Optional Remote Desktop Gateway (RD Gateway) instances in the public subnets for administrative access.
- In the private subnets, a number of Enterprise Server instances that can be accessed via a TN3270 terminal emulator or HTTP.
- A Network Load Balancer to automatically distribute requests for the BankDemo demonstration applications to the deployed Enterprise Server instances.

This is how the Enterprise Server instances are configured for use with the BankDemo demonstration applications. If you modify the AWS CloudFormation template (to tailor it for use for use with other applications), you must allow the required protocols through the load balancer and specify the required number of instances.

**Note**  The Quick Start can deploy a maximum of two Enterprise Server instances for demonstration purposes. If you are an SI who wants to launch additional Enterprise Server instances as part of a migration project, you must modify the templates supplied with this Quick Start.

- An optional Fileshare instance that is preconfigured to be accessible from the Enterprise Server instances (via Fileshare) and accessible directly via the Common Internet File System (CIFS) protocol share for batch processing.
- Optional Microsoft SQL Server database connectivity using Amazon Relational Database Service (Amazon RDS) for SQL Server with support for failover and automated backups.
- AWS Directory Service for Microsoft Active Directory (also known as AWS Managed Microsoft AD).
* The template that deploys the Quick Start into an existing VPC skips the tasks marked by asterisks and prompts you for your existing VPC configuration and AWS Managed Microsoft AD information.

**Enterprise Server Architecture Overview**

For an overview of Enterprise Server architecture, see [Enterprise Server Architecture](#) and [Enterprise Server Instance Architecture](#) in the Enterprise Server product documentation.

In addition to the standard Enterprise Server installation, other software requirements depend on the user application and third-party components. In an existing rehosted distributed environment, these third-party components will already be in place. They need to be reviewed to ensure they are compatible in the AWS environment.

![Figure 2: Reference architecture for Enterprise Server in a non-cloud environment](image-url)
Prerequisites

Technical Requirements

This Quick Start uses a Bring Your Own License (BYOL) model for Enterprise Server. If you are an existing user of Enterprise Server, you can use one of your existing licenses. If you are not an existing user of Enterprise Server, you need to request a trial license from Micro Focus. For more information, see Cost and Licenses.

The BankDemo demonstration application that is included as part of this Quick Start requires the use of a TN3270 terminal emulator. You can use any TN3270 terminal emulator, but this guide shows the use of Micro Focus Rumba, which is supplied with Micro Focus Enterprise Developer.
Specialized Knowledge

Before you deploy this Quick Start, we recommend that you become familiar with the following AWS services. (If you are new to AWS, see Getting Started with AWS.)

- Amazon Elastic Block Store (Amazon EBS)
- Amazon Elastic Compute Cloud (Amazon EC2)
- Amazon Relational Database Service (Amazon RDS)
- Amazon Virtual Private Cloud (Amazon VPC)
- AWS CloudFormation
- AWS Directory Service for Microsoft Active Directory (also known as AWS Managed Microsoft AD)

Deployment Options

This Quick Start provides two deployment options:

- **Deploy Enterprise Server into a new VPC** (end-to-end deployment). This option builds a new AWS environment consisting of the VPC, subnets, NAT gateways, security groups, AWS Managed Microsoft AD, Remote Desktop Gateway (RD Gateway), and other infrastructure components, and then deploys Enterprise Server into this new VPC.

- **Deploy Enterprise Server into an existing VPC**. This option provisions Enterprise Server in your existing AWS infrastructure.

The Quick Start provides separate templates for these options. It also lets you configure CIDR blocks, instance types, and Enterprise Server settings, as discussed later in this guide.

Deployment Steps

Step 1. Prepare Your AWS Account

1. If you don’t already have an AWS account, create one at [https://aws.amazon.com](https://aws.amazon.com) by following the on-screen instructions.
2. Use the region selector in the navigation bar to choose the AWS Region where you want to deploy Enterprise Server on AWS.

**Important** This Quick Start includes AWS Directory Service which isn’t supported in all AWS Regions. See [AWS Regions and Endpoints](#) for a list of supported regions.

When deploying the RDS Remote Database option, Amazon RDS does not support Windows (domain) Authentication in all AWS Regions. See [Using Windows Authentication with a Microsoft SQL Server DB Instance](#).

3. Amazon EC2 uses public-key cryptography to encrypt and decrypt login information. To be able to log in to your instances, you must create a `key pair` in your preferred region. To do this:
   a. In the navigation pane of the Amazon EC2 console, select `Key Pairs`.
   b. Choose `Create Key Pair`.
   c. Specify the name for the key pair.
   d. Choose `Create`.

![Figure 4: Creating a key pair](#)

4. If necessary, [request a service limit increase](#) for the relevant Amazon EC2 instance types. You might need to do this if you have an existing deployment that uses this instance type, and you think you might exceed the `default limit` with this deployment.
Step 2. Review the Micro Focus End User License Agreement

Before launching this Quick Start for Enterprise Server, you must review the terms of the Micro Focus End User License Agreement. You will be asked to accept the terms of the End User License Agreement during deployment.

Step 3. Launch the Quick Start

**Note** You are responsible for the cost of the AWS services used while running this Quick Start reference deployment. There is no additional cost for using this Quick Start. For full details, see the pricing pages for each AWS service you will be using in this Quick Start. Prices are subject to change.

1. Choose one of the following options to launch the AWS CloudFormation template into your AWS account. For help choosing an option, see Deployment Options earlier in this guide.

   **Option 1**
   Deploy Enterprise Server into a new VPC on AWS
   ![Launch](Launch)

   **Option 2**
   Deploy Enterprise Server into an existing VPC on AWS
   ![Launch](Launch)

**Important** If you’re deploying Enterprise Server into an existing VPC, make sure that your VPC has two private subnets in different Availability Zones for the database instances. These subnets require NAT gateways or NAT instances in their route tables, to allow the instances to download packages and software without exposing them to the internet.

When deploying into an existing VPC, the Quick Start requires AWS Directory Service for Microsoft Active Directory (also known as AWS Managed Microsoft AD).

You will also need the domain name option and AWS Managed Microsoft AD domain name servers configured in the DHCP options, as explained in the Amazon VPC documentation. You will be prompted for your VPC settings when you launch the Quick Start.

Each deployment takes about 1 hour and 15 minutes to complete.
2. Check the region that’s displayed in the upper-right corner of the navigation bar, and change it if necessary. This is where the network infrastructure for Enterprise Server will be built. The template is launched in the US East (N. Virginia) Region by default.

3. On the **Select Template** page, keep the default setting for the template URL, and then choose **Next**.

4. On the **Specify Details** page, the stack name field is pre-populated; change it if needed. Review the parameters for the template and provide values for the parameters that require input. For all other parameters, review the default settings and customize them as necessary.

You will need to specify values for at least the following parameters:

- License agreement
- Enterprise Server license filename. The name of a valid license (.mflic) file for Enterprise Server.
- Availability Zones
- Domain admin password (and Re-enter the Domain admin password)
- Key Pair Name. See the AWS documentation on [key pairs](https://aws.amazon.com/documentation/key-pairs/) for more information.
- Enterprise Server S3 bucket name. The name of the S3 bucket containing the Enterprise Server license file. See the AWS documentation on [Creating a Bucket](https://aws.amazon.com/documentation/s3/) for more information.
- Database Master User password (and Re-enter the Database Master User password)
- Enterprise Server Demo User password (and Re-enter the Enterprise Server Demo User password)

Specifying values for these parameters and accepting the default values for all other parameters will enable you to launch the Quick Start to run the BankDemo application.

**Note** The Quick Start is configured to install the Fileshare and SQL versions of the BankDemo demonstration application. If you do not want to run a demonstration application to test the deployment once it has finished, you must select **false** for both the [Install Fileshare Demo App](https://aws.amazon.com) and [Install SQLServer Demo App](https://aws.amazon.com) parameters.
In the following tables, parameters are listed by category and described separately for the two deployment options:

- **Parameters for deploying Enterprise Server into a new VPC**
- **Parameters for deploying Enterprise Server into an existing VPC**

When you have finished reviewing and customizing the parameters, choose **Next**.

- **Option 1: Parameters for deploying Enterprise Server into a new VPC**

  **View template**

  **Software License Agreement:**

<table>
<thead>
<tr>
<th>Parameter label (name)</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>License agreement (LicenseAgreement)</td>
<td>–</td>
<td>You must agree to the terms and conditions. I have read and agree to the license terms for Micro Focus Enterprise Server (<a href="https://www.microfocus.com/documentation/enterprise-developer/ed-latest/ES-WIN/GUID-0562B3C9-2271-4CE8-AF64-93DE4940077F.html">https://www.microfocus.com/documentation/enterprise-developer/ed-latest/ES-WIN/GUID-0562B3C9-2271-4CE8-AF64-93DE4940077F.html</a>).</td>
</tr>
</tbody>
</table>

  **Enterprise Server license filename (ESLicenseFilename)** | Requires input | Place the license file obtained from Micro Focus in the S3 bucket folder: s3://<Enterprise Server S3 bucket name>/license/ |

**Network Configuration:**

<table>
<thead>
<tr>
<th>Parameter label (name)</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPC CIDR (VPCCIDR)</td>
<td>10.0.0.0/16</td>
<td>The CIDR block for the VPC. The CIDR block must be in the form x.x.x.x/16-28.</td>
</tr>
</tbody>
</table>

| Public Subnet 1 CIDR (PublicSubnet1CIDR) | 10.0.128.0/20 | The CIDR block for the public (DMZ) subnet 1 located in Availability Zone 1. The CIDR block must be in the form x.x.x.x/16-28. |

| Public Subnet 2 CIDR (PublicSubnet2CIDR) | 10.0.144.0/20 | The CIDR block for the public (DMZ) subnet 2 located in Availability Zone 2. The CIDR block must be in the form x.x.x.x/16-28. |

| Private Subnet 1A CIDR (PrivateSubnet1ACIDR) | 10.0.0.0/19 | The CIDR block for the private subnet 1 located in Availability Zone 1. The CIDR block must be in the form x.x.x.x/16-28. |

| Private Subnet 2A CIDR (PrivateSubnet2ACIDR) | 10.0.32.0/19 | The CIDR block for the private subnet 2 located in Availability Zone 2. The CIDR block must be in the form x.x.x.x/16-28. |
### Parameter label (name) | Default | Description |
--- | --- | ---
Availability Zones (AvailabilityZones) | **Requires input** | The list of Availability Zones to use for the subnets in the VPC. The Quick Start uses two Availability Zones from your list and preserves the logical order you specify.  

### Microsoft Active Directory Configuration:

### Parameter label (name) | Default | Description |
--- | --- | ---
AWS Managed Microsoft AD Edition (DSMicrosoftADEdition) | Standard | Standard Edition includes 1 GB of storage for objects. Enterprise Edition includes 17 GB. The total number of objects supported depends on the types of objects, size of data stored in attributes, and your transaction rates. Scale-out as needed by adding domain controllers.  

Domain DNS name (DomainDNSName) | example.com | The fully qualified domain name (FQDN), e.g., example.com. Must be 2-255 characters.  

Domain NetBIOS name (DomainNetBIOSName) | example | The NetBIOS name of the domain (up to 15 characters) for users of earlier versions of Microsoft Windows, e.g., example.  

Domain Admin account password (DomainAdminPassword) | **Requires input** | The password for the domain Admin account. Must be at least 8 characters containing letters, numbers, and symbols.  

Re-enter the domain Admin account password (DomainAdminPassword Confirm) | **Requires input** | Confirm the password for the domain Admin account. Must be at least 8 characters containing letters, numbers, and symbols.  

### Remote Desktop Gateway Configuration:

### Parameter label (name) | Default | Description |
--- | --- | ---
Number of RD Gateway hosts (NumberOfRDGWHosts) | 1 | If you choose 'None', the remaining Remote Desktop Gateway configuration parameters are ignored.  

RD Gateway instance type (RDGWInstanceType) | t2.large | The Amazon EC2 instance type for the Remote Desktop Gateway instances.  

Allowed RD Gateway external access CIDR (RDGWCIDR) | **Requires input** | The allowed CIDR block for external access to the Remote Desktop Gateway. The CIDR block must be in the form x.x.x.x/x.
**Enterprise Server Configuration:**

<table>
<thead>
<tr>
<th>Parameter label (name)</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise Server instance type (ESInstanceType)</td>
<td>c5.large</td>
<td>The type of Enterprise Server instance.</td>
</tr>
<tr>
<td>Number of Enterprise Server instances (NumberOfESInstance)</td>
<td>1</td>
<td>The number of Enterprise Server instances to start.</td>
</tr>
<tr>
<td>Key pair name (KeyPairName)</td>
<td>Admin</td>
<td>The name of an existing EC2 key pair. All instances will launch with this key pair.</td>
</tr>
<tr>
<td>Number of Enterprise Server regions per instance (RegionsPerInstance)</td>
<td>1</td>
<td>The number of regions per Enterprise Server instance. Must be between 1 and 10 regions per instance.</td>
</tr>
<tr>
<td>Additional Enterprise Server instance storage (AdditionalESSStorageinGiB)</td>
<td>100</td>
<td>Additional EBS storage capacity in gibibytes (GiBs) added to each Enterprise Server instance. Enter 0-16384 GiB.</td>
</tr>
<tr>
<td>Enterprise Server CCITCP listener port (ESCCITCPListenerPort)</td>
<td>86</td>
<td>The TCP port in the range 1-65535.</td>
</tr>
<tr>
<td>Amazon CloudWatch log retention (ESCWLogGroupRetentionInDays)</td>
<td>7</td>
<td>The number of days that log events are kept in Amazon CloudWatch Logs.</td>
</tr>
<tr>
<td>Micro Focus Directory Server service domain account name (MFDSServiceAccount Name)</td>
<td>MFDSServiceAccount</td>
<td>The existing domain account name under which the service will run. If left as default, a domain account 'MFDSServiceAccount' is created. The name must be 5-25 characters.</td>
</tr>
<tr>
<td>Micro Focus Directory Server service account password (MFDSServiceAccount Password)</td>
<td>Requires input</td>
<td>Enter a password for MFDSServiceAccount. Must be at least 8 characters containing letters, numbers, and symbols.</td>
</tr>
<tr>
<td>Re-enter the Micro Focus Directory Server service account password (MFDSServiceAccount PasswordConfirm)</td>
<td>Requires input</td>
<td>Confirm the password for MFDSServiceAccount. Must be at least 8 characters containing letters, numbers, and symbols.</td>
</tr>
<tr>
<td>Parameter label (name)</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Operator email address (OperatorEmail)</td>
<td>None</td>
<td>(optional) The email address that notifications are sent to (e.g., database, VM failures, etc.).</td>
</tr>
<tr>
<td>Enterprise Server S3 bucket name (ESS3BucketName)</td>
<td><strong>Requires input</strong></td>
<td>The name of the existing S3 bucket used to store/retrieve objects specific to this stack. A system integrator extending this Quick Start should use this bucket to store or retrieve items needed. This string can include numbers, lowercase letters, uppercase letters, and hyphens (-). It cannot start or end with a hyphen (-).</td>
</tr>
<tr>
<td>Resource 'Name' prefix (ESResourceNamePrefix)</td>
<td>AWS::StackName</td>
<td>Used to prefix resource 'Name' tags. Leave empty for no prefix. Otherwise, use 'AWS::StackName' or a value such as the parent stack's name.</td>
</tr>
</tbody>
</table>

### Enterprise Server Fileshare Configuration:

<table>
<thead>
<tr>
<th>Parameter label (name)</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fileshare type (FileshareType)</td>
<td>Create-Remote-Fileshare-Server</td>
<td>If you choose 'None', the remaining Fileshare Configuration parameters are ignored.</td>
</tr>
<tr>
<td>Install Fileshare Demo App (InstallFSDemoApp)</td>
<td>True</td>
<td>Choose 'false' if you don’t want to install the Enterprise Server Fileshare demo app. Requires selection of the 'Create-Remote-Fileshare-Server' Fileshare type.</td>
</tr>
<tr>
<td>Enterprise Server Fileshare instance type (FSInstanceType)</td>
<td>c5.large</td>
<td>The type of Enterprise Server Fileshare instance.</td>
</tr>
<tr>
<td>Fileshare allocated storage size (FSStorageInGiB)</td>
<td>250</td>
<td>Enter 1-16384 GiB.</td>
</tr>
<tr>
<td>Enterprise Server Fileshare CCITCP listener port (FSCCITCPListenerPort)</td>
<td>3000</td>
<td>The TCP port in the range 1-65535.</td>
</tr>
<tr>
<td>FSVIEW user password (FSVIEWUserPassword)</td>
<td><strong>Requires input</strong></td>
<td>The password for the FSVIEW user. Must be at least 8 characters containing letters, numbers, and symbols.</td>
</tr>
<tr>
<td>Re-enter the FSVIEW user password (FSVIEWUserPassword Confirm)</td>
<td><strong>Requires input</strong></td>
<td>Confirm the password for the FSVIEW user. Must be at least 8 characters containing letters, numbers, and symbols.</td>
</tr>
</tbody>
</table>
### Database Configuration:

<table>
<thead>
<tr>
<th>Parameter label (name)</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database type (DatabaseType)</td>
<td>Create-RDS-Remote-Database</td>
<td>If you choose 'None', the remaining Database Configuration parameters are ignored.</td>
</tr>
<tr>
<td>Install SQLServer Demo App (InstallSQLDemoApp)</td>
<td>True</td>
<td>Choose ‘false’ if you don’t want to install the Enterprise Server SQL Server demo app. Requires selection of the 'Create-RDS-Remote-Database' Database type.</td>
</tr>
<tr>
<td>Database instance class (DBInstanceClass)</td>
<td>db.r4.large</td>
<td>The type of Amazon RDS DB instance.</td>
</tr>
<tr>
<td>Database allocated storage size (DBStorageInGiB)</td>
<td>100</td>
<td>Enter 20-16384 GiB.</td>
</tr>
<tr>
<td>Database Master username (DBMasterUsername)</td>
<td>DBAdmin</td>
<td>Specify an alphanumeric string that defines the login ID for the master user. Master user name must start with a letter. Must contain 1 to 64 alphanumeric characters.</td>
</tr>
<tr>
<td>Database Master password (DBMasterUserPassword)</td>
<td>Requires input</td>
<td>The password for the DB master user. Must be at least eight characters long, as in &quot;mypassword&quot;. Can be any printable ASCII character except &quot;/&quot;, &quot;&quot;&quot;, or &quot;@&quot;.</td>
</tr>
<tr>
<td>Re-enter the database Master User password (DBMasterUserPassword Confirm)</td>
<td>Requires input</td>
<td>Confirm the password for the DB master user. Must be at least eight characters long, as in &quot;mypassword&quot;. Can be any printable ASCII character except &quot;/&quot;, &quot;&quot;&quot;, or &quot;@&quot;.</td>
</tr>
<tr>
<td>Deploy in multiple Availability Zones (DeployMultiAZ)</td>
<td>False</td>
<td>Choose 'true' to deploy the database across multiple Availability Zones.</td>
</tr>
<tr>
<td>Database backup retention period (DBBackupRetention Period)</td>
<td>30</td>
<td>The number of days that Amazon RDS should retain automatic backups of the DB instance. A backup retention period of zero days will disable automated backups for the DB Instance.</td>
</tr>
<tr>
<td>Database preferred backup window (DBPreferredBackup Window)</td>
<td>Requires input</td>
<td>Must be in the format hh24:mi-hh24:mi, in UTC. Must be at least 30 minutes, and must not conflict with the preferred maintenance window.</td>
</tr>
<tr>
<td>Database preferred maintenance window (DBPreferredMaintenance Window)</td>
<td>Requires input</td>
<td>Must be in the format ddd:hh24:mi-ddd:hh24:mi, in UTC. Must be at least 30 minutes.</td>
</tr>
</tbody>
</table>
### Enterprise Server Demo Apps Configuration:

<table>
<thead>
<tr>
<th>Parameter label (name)</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise Server Demo User password</td>
<td>Requires input</td>
<td>The password for the ESDemoUser. Must contain 8 to 32 characters, at least one uppercase letter, one lowercase letter, one number and one special character.</td>
</tr>
<tr>
<td>Re-enter the Enterprise Server Demo User password Confirm</td>
<td>Requires input</td>
<td>Confirm password for the ESDemoUser. Must contain 8 to 32 characters, at least one uppercase letter, one lowercase letter, one number and one special character.</td>
</tr>
<tr>
<td>Allowed Demo Apps external access CIDR</td>
<td>Requires input</td>
<td>The allowed CIDR block for external access to the demo apps. The CIDR block parameter must be in the form x.x.x/x.</td>
</tr>
<tr>
<td>Fileshare Bank Demo TN3270 Port</td>
<td>5555</td>
<td>The TN3270 port must be a number (1-65535).</td>
</tr>
<tr>
<td>SQLServer Bank Demo TN3270 Port</td>
<td>5349</td>
<td>The TN3270 port must be a number (1-65535).</td>
</tr>
</tbody>
</table>

### AWS Quick Start Configuration:

<table>
<thead>
<tr>
<th>Parameter label (name)</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick Start S3 bucket name</td>
<td>aws-quickstart</td>
<td>The S3 bucket you have created for your copy of Quick Start assets, if you decide to customize or extend the Quick Start for your own use. The bucket name can include numbers, lowercase letters, uppercase letters, and hyphens (-), but should not start or end with a hyphen.</td>
</tr>
<tr>
<td>Quick Start S3 key prefix</td>
<td>quickstart-microfocus-amc-es/</td>
<td>The S3 key name prefix used to simulate a folder for your copy of Quick Start assets, if you decide to customize or extend the Quick Start for your own use. This prefix can include numbers, lowercase letters, uppercase letters, hyphens (-), and forward slashes (/).</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>Private Subnet 2A ID (PrivateSubnet2AID)</td>
<td><strong>Requires input</strong></td>
<td>The ID of private subnet 2A in Availability Zone 2 (e.g., subnet-01a43dc1c1a1fa7f9b).</td>
</tr>
<tr>
<td>Availability Zones (AvailabilityZones)</td>
<td><strong>Requires input</strong></td>
<td>The list of Availability Zones to use for the subnets in the VPC. The Quick Start uses two Availability Zones from your list and preserves the logical order you specify.</td>
</tr>
</tbody>
</table>

**Microsoft Active Directory Configuration:**

<table>
<thead>
<tr>
<th>Parameter label (name)</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directory Service ID (DirectoryServiceID)</td>
<td><strong>Requires input</strong></td>
<td>The ID of the AWS Managed Microsoft AD directory in which you want to deploy.</td>
</tr>
<tr>
<td>Domain DNS name (DomainDNSName)</td>
<td>example.com</td>
<td>The fully qualified domain name (FQDN), e.g., example.com. Must be 2-255 characters.</td>
</tr>
</tbody>
</table>
## Domain NetBIOS name
Domain NetBIOS name (DomainNetBIOSName)  example  The NetBIOS name of the domain (up to 15 characters) for users of earlier versions of Microsoft Windows, e.g., example.

## Domain member Security Group ID
Domain member Security Group ID (DomainMemberSGID)  Requires input  The ID of the Domain Member Security Group (e.g., sg-7f16e910).

## Domain Admin account password
Domain Admin account password (DomainAdminPassword)  Requires input  The password for the domain Admin account. Must be at least 8 characters containing letters, numbers, and symbols.

## Re-enter the domain Admin account password
Re-enter the domain Admin account password (DomainAdminPassword Confirm)  Requires input  Confirm the password for the domain Admin account. Must be at least 8 characters containing letters, numbers, and symbols.

### Remote Desktop Gateway Configuration:

</tbody>
</table>

**AWS Quick Start Configuration:**

<table>
<thead>
<tr>
<th>Parameter label (name)</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick Start S3 bucket name (QSS3BucketName)</td>
<td>aws-quickstart</td>
<td>The S3 bucket you have created for your copy of Quick Start assets, if you decide to customize or extend the Quick Start for your own use. The bucket name can include numbers, lowercase letters, uppercase letters, and hyphens (-), but should not start or end with a hyphen.</td>
</tr>
<tr>
<td>Quick Start S3 key prefix (QSS3KeyPrefix)</td>
<td>quickstart-</td>
<td>The S3 key name prefix used to simulate a folder for your copy of Quick Start assets, if you decide to customize or extend the Quick Start for your own use. This prefix can include numbers, lowercase letters, uppercase letters, hyphens (-), and forward slashes (/).</td>
</tr>
</tbody>
</table>

5. On the **Options** page, you can **specify tags** (key-value pairs) for resources in your stack and **set advanced options**. When you’re done, choose **Next**.

6. On the **Review** page, review and confirm the template settings. Under **Capabilities**, select the check box to acknowledge that the template will create IAM resources.

7. Choose **Create** to deploy the stack.

8. Monitor the status of the stack. When the status is **CREATE_COMPLETE**, the Enterprise Server cluster is ready.

9. Use the URLs displayed in the **Outputs** tab for the stack to view the resources that were created. Some of the values listed in the **Key** column of the **Outputs** tab depend on the settings of some of the stack's parameters, so you might not see all of the options shown in the following figure.
Figure 5: CloudFormation Outputs tab after stack creation

Step 4. Test the Deployment

To test the deployment, you run a demonstration application called BankDemo.

BankDemo is a demonstration application for an imaginary banking company and provides simple banking functionality such as displaying accounts and transactions, transferring funds between accounts, and changing users' contact details. The source code for BankDemo is supplied with Enterprise Developer, which is a Micro Focus product that enables you to develop and maintain mainframe COBOL and PL/I applications.

This Quick Start for Enterprise Server includes deployable files that have been built using Enterprise Developer. Running BankDemo after you have launched this Quick Start enables you to verify that the Quick Start has deployed as expected and that Enterprise Server is running successfully on AWS.

This Quick Start includes two versions of BankDemo that differ in the types of data that they use (and therefore the types of AWS instances that they require):

- One version of BankDemo uses VSAM data files that are processed by Fileshare, so requires a Fileshare instance.
- The other version uses a SQL Server database, so requires an Amazon RDS instance.

Most of the information in the rest of this section applies equally to the Fileshare and SQL versions of BankDemo. Information that applies only to one version is marked accordingly.

Note The files for the BankDemo demonstration applications are only installed if you set the Install Fileshare Demo App or Install SQLServer Demo App parameters to true when launching this Quick Start. To run the BankDemo demonstration application you must have a TN3270 terminal emulator. The following instructions use Micro Focus Rumba, which is supplied with Micro Focus Enterprise Developer.
Both versions of the BankDemo application can run in online mode. The Fileshare version can additionally run in batch mode.

The instructions in the remainder of this section walk you step-by-step through the process of performing the following operations:

- Connecting to the BankDemo enterprise server
- Running BankDemo in online mode
- Running BankDemo in batch mode (Fileshare version only)
- Housekeeping after running BankDemo

Connecting to the BankDemo Enterprise Server

The BankDemo application runs in an enterprise server that’s started automatically when you launch this Quick Start. This section describes how to connect to this enterprise server. Use your TN3270 terminal emulator to connect to the load balancer using the following details:

```
load-balancer-DNS-name:port
```

where:

- `load-balancer-DNS-name` is the DNS name of the load balancer. This is the value specified for the `ESDemoAppsPublicNetworkLoadBalancer` key on the Enterprise Server stack’s `Outputs` tab (as shown in Figure 5).

- `port` is the port number to use. This is the value specified for either the `FSDemoApp3270Port` or `SQIDemoApp3270Port` key on the Enterprise Server stack’s `Outputs` tab (as shown in Figure 5), depending on whether you want to run the Fileshare version of BankDemo or the SQL version.

**Note** Some TN3270 terminal emulators place a limit on the length of the name to connect to. If that limit is less than the length of `load-balancer-DNS-name` you can find the load balancer’s IP address by using the following command:

```
ping load-balancer-DNS-name
```

Once you have this information, you can connect your TN3270 terminal emulator to `load-balancer-IP-address:port` instead of `load-balancer-DNS-name:port`. 
Once connected to the Fileshare version of the BankDemo application, you will see a screen similar to the one in Figure 6. When you connect to the SQL version of BankDemo, you will see a blank screen instead.

![Mainframe TN3270 Display](image)

**Figure 6: The Enterprise Server region for the Fileshare version of BankDemo**

Now that you're connected, you're ready to run the BankDemo application in online mode.

*Running BankDemo in Online Mode*

You can now perform the following steps to run the BankDemo application in online mode:

1. Press **Ctrl+Shift+Z** to clear the screen.
2. Enter the name of the transaction to run:

   BANK

   The BankDemo sign-on screen is displayed, as shown in Figure 7.
This screen being displayed is confirmation that the BankDemo application is running under Enterprise Server on AWS.

The rest of this section describes how you can try out some of BankDemo's features in online mode, to verify that it is able to read and write data as expected.

If you don't want to try out these BankDemo features in online mode, your next step depends on which version of BankDemo you're running:

- If you are running the Fileshare version of BankDemo, you can jump to the section Running BankDemo in Batch Mode.
- If you are running the SQL version of BankDemo, you can jump to the section Housekeeping after Running BankDemo.

The remaining steps in this section enable you to verify that BankDemo can read and write data by logging in as a user, viewing the user's balance, transferring an amount between two
of the user's accounts, and viewing the user's balance again to confirm that the transfer has happened.

**Tip**  Each screen of the BankDemo application has its own help page, which you can access by pressing **F1**.

3. From the BankDemo sign-on screen, specify a valid user ID, press **Tab**, and then enter a password. Valid user IDs are B0001 - B0036. This demonstration uses B0004.

   You can use any valid user ID, but if you choose a user other than B0004, the data presented on the screens that you see will be different from the data shown in the figures from this point on.

   The password can be any non-blank character string. Once successfully logged on, you see the BankDemo main options screen:

```
Welcome to the almost on-line banking system.

Please select one of the following options:

- Display your account balances
- Transfer funds between accounts
- Update your contact information
- Calculate the cost of a loan
- Request printed statement(s)
- Obtain more information
```

![Mainframe TN3270 Display](image)

*Figure 8: The BankDemo main options screen*
4. The cursor is positioned on the first option, **Display your account balances**. Press **X**, and then press **Enter**. The BankDemo account balances screen is displayed, showing the balances of the different accounts held by this user:

![Mainframe TN3270 Display](image)

**Figure 9: The BankDemo account balances screen**

5. Press **F4** to return to the BankDemo main options screen.

6. Now we want to transfer some funds from one account to another. You can see from Figure 9 that this user's checking account is overdrawn, so we will transfer $80 from the savings account to the checking account.

Press **Tab** so that the cursor is positioned next to the **Transfer funds between accounts** option, press **X**, and then press **Enter**.

The BankDemo balance transfer screen is displayed, showing the user's accounts, their balances, and options to move an amount from one account to another.
Figure 10: The BankDemo balance transfer screen

7. The cursor is positioned next to the **Enter amount to be transferred** prompt. Specify **80.00** and then press **Tab**.

8. The cursor is now positioned in the **From** column of the savings account. This is the account that we want to transfer money from. Press **X**, and then press **Tab** twice.

9. The cursor is now positioned in the **To** column of the checking account. This is the account that we want to transfer money into. Press **X**, and then press **Enter**. The account balances are updated, and a message appears toward the bottom of the screen summarizing the transfer.

10. Press **F4** to return to the BankDemo main options screen.

11. Although the balance transfer screen showed us the changed account balances after we had carried out the transfer, we will now display the account balances screen again. This is to confirm that the data has been updated and that we can read it.

   The cursor is positioned on the first option, **Display your account balances**. Press **X**, and then press **Enter**.
The account balances screen is displayed, showing the balances that reflect the changes that were made.

12. Press F3 to exit BankDemo.

**Running BankDemo in Batch Mode**

If you’re running the Fileshare version of BankDemo, you can now run it in batch mode. The steps required to do this can be summarized as follows:

1. **Close the BankDemo data files.**
2. **Submit the BankDemo JCL job.**
3. **View the output.**
4. **Reopen the BankDemo data files.**

**Closing the BankDemo Data Files**

1. Still in your TN3270 terminal emulator, press Ctrl+Shift+Z to clear the screen.
2. Enter the following, which is the name of a supplied transaction to close BankDemo's data files: **CFIL**

   A message is displayed confirming that the data files have been closed.

**Submitting the BankDemo JCL Job**

To submit the JCL job, connect to the Enterprise Server instance. To access the Enterprise Server instance, connect to the Remote Desktop Gateway instance.

1. From the Enterprise Server stack’s Outputs tab (see Figure 5), select the value specified for the **RemoteDesktopGatewayIP** key, and copy it to the clipboard.

2. Use Remote Desktop Connection to connect to the Remote Desktop Gateway instance specifying the following credentials:
   a. Computer: The IP address you copied to the clipboard at step 1.
b. User name: `domain\ESDemoUser`, where `domain` is the value specified for the Domain NetBIOS name parameter when you launched the Quick Start. The default value for this parameter is "example".

c. Password: The value specified for the Enterprise Server Demo User password parameter when you launched the Quick Start.

3. Now that you are connected to the Remote Desktop Gateway instance you can connect to the Enterprise Server instance.

From the Remote Desktop Gateway instance, use Remote Desktop Connection to connect to the Enterprise Server instance specifying the following credentials:

   a. Computer: ESSERVER1

   b. User name: `domain\ESDemoUser`, where `domain` is the value specified for the Domain NetBIOS name parameter when you launched the Quick Start. The default value for this parameter is "example".

   c. Password: The value specified for the Enterprise Server Demo User password parameter when you launched the Quick Start.

4. On ESSERVER1, start Microsoft Internet Explorer, and enter the following text into the address bar:

   ```http://localhost:86```

   Internet Explorer opens showing the Enterprise Server Administration page. A number of enterprise servers is listed. The name of the enterprise server where BankDemo is running is BNKDMFS.

5. Choose Details in the Status column of the row for the BNKDMFS enterprise server.

   The details screen for the BNKDMFS enterprise server is displayed.

   The Enterprise Server Monitor and Control (ESMAC) screen is displayed.

7. Ensure that JES is selected in the dropdown list under Resources.

8. Choose Control in the Resources part of the ESMAC menu.

9. Choose Choose File, and then navigate to the folder `c:\BankDemo_FS\jcl`. Select the file `ZBNKSTMT.jcl`, and then choose Open.

10. Choose Submit.
Messages above the **Submit** button confirm that the JCL job has been submitted. The JCL job that you submitted reads one of the BankDemo data files, sorts the data in it, and then prints the results.

**Viewing the Output**

1. Choose **Spool**.

   The Spool view shows the output from recently-run jobs. The output from the job you just submitted is listed under **MFIDEMO**.

2. Choose **MFIDEMO** in the **Name** column.

   Informational messages that were generated while the job was running are displayed.

3. Scroll to the bottom of the screen where you can see a number of **Details** buttons, and choose the **PRINTOUT** entry in the **DD Name** column.

   The output from the JCL job is displayed, showing that you have successfully run BankDemo in batch mode.

**Reopening the BankDemo Data Files**

After you have run BankDemo in batch mode, if you want to run it again in online mode, you must first reopen the data files.

1. Switch back to your TN3270 terminal emulator, and then press **Ctrl+Shift+Z** to clear the screen.

2. Enter the following, which is the name of a supplied transaction to open BankDemo's data files:

   ```
   OFIL
   ```

   A message is displayed confirming that the data files have been opened. You are now free to run BankDemo in online mode again.

**Housekeeping after Running BankDemo**

After you have finished with BankDemo, disconnect from the running enterprise server, and then stop the enterprise server:

1. Choose the **Disconnect** button () on the Rumba toolbar to disconnect from the running enterprise server.
2. Stop whichever of the BNKDMFS or BNKDMSQL enterprise servers are running:
   a. Connect to ESSERVER1 as ESDemoUser if you are not already connected to it. See Submitting the BankDemo JCL Job for information on how to do this.
   b. Start Internet Explorer and enter the following text into the address bar:

   ![http://localhost:86]

   Internet Explorer opens showing the Enterprise Server Administration page. A number of enterprise servers are listed.
   c. On the Enterprise Server Administration page, choose **Stop** in the **Status** column of the row for the enterprise server that you want to stop.

   A screen is displayed indicating the server details and security configuration information. This screen also gives you the option of specifying operating system and Enterprise Server security credentials to be used.
   d. Choose **OK**.

   The Home page of Enterprise Server Administration is displayed, and the **Status Log** column displays server termination progress messages.
   e. After a few seconds, choose **Refresh** on the Home page. The value in the **Status column** has changed to **Stopped**.

   **Note** The preceding instructions show how to stop an enterprise server using the Enterprise Server Administration pages.

   If you have started an enterprise server from an Enterprise Server command prompt, however, you must also stop it from an Enterprise Server command prompt. (Similarly, if you started an enterprise server from the Enterprise Server Administration pages, you must stop it from the Enterprise Server Administration pages.)

   To stop an enterprise server from an Enterprise Server command prompt, connect to ESSERVER1, open an Enterprise Server command prompt, and enter the relevant command.

   The command to stop an enterprise server for the Fileshare version of BankDemo is as follows:

   `casstop -rbnkdmfs`
The command to stop an enterprise server for the SQL version of BankDemo is as follows:

casstop -rbnkdmsql

Starting the BankDemo Enterprise Server Manually

The BNKDMFS and BNKDMSQL enterprise servers are started automatically when you launch this Quick Start. As a result, if you stop these enterprise servers and then want to re-run the BankDemo application, you must manually start the enterprise server that is appropriate for the version of BankDemo that you want to run.

1. Connect to ESSERVER1 as ESDemoUser, if you aren’t already connected to it. See Submitting the BankDemo JCL Job for information on how to do this.

2. Choose Start in the Status column of the row for the enterprise server that you want to start.

   A screen is displayed showing the server details and security configuration information. This screen also gives you the option of specifying operating system and Enterprise Server security credentials to be used.

3. Choose OK. The Enterprise Server Administration Home page is displayed, and progress is shown in the Status Log column.

4. After a few seconds, choose Refresh on the Home page. When the server starts, the value in the Status column changes to Started.

   **Note** The preceding instructions show how to start enterprise servers using the Enterprise Server Administration pages. If you would rather use the command line to start your enterprise server, connect to ESSERVER1, open an Enterprise Server command prompt, and enter the relevant command.

The command to start an enterprise server for the Fileshare version of BankDemo is as follows:

casstart -rbnkdmfs

The command to start an enterprise server for the SQL version of BankDemo is as follows:

casstart -rbnkdmsql

Whichever method you use to start an enterprise server (command line or Enterprise Server Administration pages), you must use the same method to stop it.
Best Practices Using Enterprise Server on AWS

The best practices that apply to using Enterprise Sever in a non-AWS environment also apply to using Enterprise Sever on AWS. See Diagnostic Best Practice in Micro Focus Enterprise Server for more information.

Security

Information on security-related aspects of using Enterprise Server is available in Guide to Securing Enterprise Server.

Troubleshooting

Q. My application encountered an error when running under Enterprise Server. What information do I need to include when informing Micro Focus of the issue, and what is the best way of obtaining that information?

A. For all troubleshooting exercises, gather as much information as possible about the state of the enterprise server region when the problem occurred and about the events leading up to the problem. This should include the date/time that the problem occurred, observations on what was happening in the system, how long it had been running, what the symptoms were, and how/where these were observed.

When a problem occurs, capture and provide specific logs, traces and dumps, and ideally the contents of various configuration files, directories, and the output from a number of operating system tools. Do this as soon as possible after the failure occurs.

You can use the MFESdiags diagnostic collection script—MFESdiags.cmd—to collect the required Enterprise Server diagnostic information automatically.

This script is included in C:\MFESDIAGS in each Enterprise Server instance. It can be run from any command prompt or from Windows Explorer. You will be prompted for the region name. You should create a .zip file of the resultant data collection directory, and attach it to the Support Incident (SI) that you submit.

The script invokes the relevant "mfsupport" utility, which collects information about the operating system and machine hardware along with details about Micro Focus products installed.

As a minimum, if MFESdiags isn’t used to collect the data, you should collect and provide the following items as soon as possible after a failure (by zipping or ‘tar’ing the contents of the system/region directory):
• console.log
• log.html or log-*\.html (for communications problems)
• Journal log (for MFDS/security problems)
• Any casdump or aux traces
• mfSupportInfo

However, the MFESdiags data collection script collects the preceding items, and other useful information details, as follows:

• All files from the Enterprise Server's System/Region Directory, including:
  – console.log and console\.bak. The communications process log log\.html or log-*\.html.
  – Any trace diagnostic datasets, casauxta\.rec and casauxtb\.rec.
  – Any system abend dumps (casdumpa\.rec, casdumpb\.rec or casdumpx\.rec).
  – Any HSF output files (\.csv).
• The output from mfSupportInfo – contains product and system info.
• The Resource Definition File (RDO/RDT), dfhdrdat.
• The Directory Server (MFDS) log file
• The Directory Server configuration directory.

Q. I changed the value of the port specified by the Fileshare Bank Demo TN3270 Port or SQLServer Bank Demo TN3270 Port parameter, and can no longer successfully connect to the enterprise server running the BankDemo application.

A. The enterprise servers that are started automatically when you launch the Quick Start use the default values for these ports (5555 and 5349, respectively). If you make any change to these parameters when you launch the Quick Start, you must make the corresponding changes to ensure that the enterprise servers listen on the required ports.

To change the port number that an enterprise server listens on:

1. On the Enterprise Server Administration page on ESSERVER1, if the enterprise server you want to configure is running, stop it by choosing Stop in its Status column, and then choosing OK when prompted.
For information on connecting to ESSERVER1 and opening the Enterprise Server Administration page, see Submitting the BankDemo JCL Job.

2. Choose Details in the Communications Processes column for the enterprise server you want to configure.

3. If you can't see the listener you want to edit, choose All from the list of options in Listener Display Filters Process.

4. Choose Edit to the left of the TN3270 row.

5. In the Endpoint Address field, replace the port number specified after the colon with the port number you specified using the Fileshare Bank Demo TN3270 Port or SQLServer Bank Demo TN3270 Port parameter when you launched the Quick Start.

6. Choose OK.

The modified enterprise server will listen on the specified port the next time it is started.

For more information see the Enterprise Server Product Documentation.

Q. I encountered a CREATE_FAILED error when I launched the Quick Start.

A. If AWS CloudFormation fails to create the stack, we recommend that you relaunch the template with Rollback on failure set to No. (This setting is under Advanced in the AWS CloudFormation console, Options page.) With this setting, the stack’s state will be retained and the instance will be left running, so you can troubleshoot the issue. (Look at the log files in \%ProgramFiles\%Amazon\EC2ConfigService and C:\cfn\log.)

> Important When you set Rollback on failure to No, you will continue to incur AWS charges for this stack. Please make sure to delete the stack when you finish troubleshooting.

For additional information, see Troubleshooting AWS CloudFormation on the AWS website.

Q. I encountered a size limitation error when I deployed the AWS CloudFormation templates.

A. We recommend that you launch the Quick Start templates from the links in this guide or from another S3 bucket. If you deploy the templates from a local copy on your computer or from a non-S3 location, you might encounter template size limitations when you create the stack. For more information about AWS CloudFormation limits, see the AWS documentation.
GitHub Repository

You can visit our GitHub repository to download the templates and scripts for this Quick Start, to post your comments, and to share your customizations with others.
